# INTRODUCTION

- ❖ The **Bank Debit & Credit Analytics Project** is an end-to-end data analytics initiative that analyzes banking transaction data to understand financial movement, customer behavior, and operational performance across branches and transaction channels.
- ❖ The project uses **SQL** for data extraction and KPI calculations, **Excel** for data cleaning and preliminary analysis, and **Power BI** and **Tableau** for creating interactive dashboards and visualizing key insights related to deposits, withdrawals, balances, and transaction trends.
- ❖ The dashboards enable stakeholders to compare debit and credit patterns, evaluate net transaction flow, monitor transaction volumes, and identify potential high-risk activities, supporting data-driven decision-making and effective risk management.

# WHY THIS PROJECT

- ❖ To understand how money moves in and out of bank accounts through debit and credit transactions.
- ❖ To compare total credit and debit amounts and check overall transaction balance.
- ❖ To identify transaction patterns across banks and branches.
- ❖ To monitor customer transaction activity and payment method usage.
- ❖ To detect suspicious and high-risk transactions for fraud monitoring.
- ❖ To support better operational control and data-driven banking decisions.

# KPI'S

<b>Total Customers: 100,000</b>	Represents a large and diverse customer base
<b>Total Credit Amount: 127.60 Million</b>	Indicates strong inflow of funds
<b>Total Debit Amount: 127.29 Million</b>	Shows comparable spending/outflow behavior
<b>Credit to Debit Ratio: 1.002:1</b>	Reflects a balanced financial transaction pattern
<b>Net Transaction Amount: 318.12K</b>	Slight positive net inflow overall
<b>Branch Transaction Amount</b>	All branches perform consistently (41M –43M range)
<b>Transaction Method Volume</b>	<ul style="list-style-type: none"><li>• Debit Card: 85.16M (33.41%)</li><li>• Credit Card: 84.93M (33.32%)</li><li>• Bank Transfer: 84.80M (33.27%)</li></ul>
<b>Suspicious Transaction Frequency</b>	<ul style="list-style-type: none"><li>• Highest: Kotak Mahindra Bank (17.5%)</li><li>• Lowest: State Bank of India (16.4%)</li></ul>

# PERFORMANCE ANALYSIS

<div>127.60M Total Credit Amount</div> <div>127.29M Total Debit Amount</div>	<div>Net Transaction Amount</div> <div>318.12k</div>	<div>100K Total Customers</div>	<div>Suspicious Transactions</div> <div>20.43k</div>
Total credit ( <b>₹127.60M</b> ) and total debit ( <b>₹127.29M</b> ) are almost equal, showing stable transaction activity.	Net transaction amount is very small, which means money flows in and out regularly without accumulation.	Indicates a high number of customers using the bank	A noticeable number of suspicious transactions highlights the need for stronger monitoring and fraud control.

group by `Transaction Method` order by count(`Transaction Method`) desc;
```

# KEY INSIGHTS

## Transaction Value Balance

Total credit stands at **₹127.60M** while total debit is **₹127.29M**, resulting in a **credit-to-debit ratio of 1.002:1**.

This reflects a highly stable transaction flow with minimal liquidity imbalance.

## Suspicious Transaction Exposure

A total of **20.43K suspicious transactions** accounting for **about 34%** of all transactions. While normal transactions dominate, This level is significantly high and requires stronger fraud detection controls.

## Branch Transaction Leadership

**The City Center Branch** records the highest transaction value at **₹42.9M**. However, the small difference across branches indicates marginal leadership rather than strong dominance.

## Monthly Transaction Pattern

Monthly transactions remain stable from January to November at around **8,500 to 9,300 transactions**. The sharp drop in December to **305 transactions** likely indicates incomplete data rather than reduced activity.

## Transaction Method Preference

Debit cards contribute the highest transaction value at **₹85.16M**, followed closely by credit cards at **₹84.93M** and bank transfers at **₹84.80M**. Customer usage is evenly distributed across payment methods.

## Transaction Volume vs Value Gap

Although transaction values are high, the net transaction amount remains very small. This indicates that customers are actively transacting, but **funds are circulating rather than accumulating**.

## Customer Base Size

The bank serves **100,000 customers**, generating very high transaction volumes. Even small inefficiencies or risks at this scale can have large financial and operational impacts.

## Net Transaction Position

The net transaction amount is **₹318.12K**, which is **less than 0.3%** of total transaction volume. This confirms a near-neutral cash position rather than a meaningful surplus.

# STRATEGIC RECOMMENDATIONS

## Use One Central Fraud System

Since suspicious transactions happen across all branches and banks, fraud monitoring should be **handled centrally instead of separately by each branch**.

## Learn From the Best Branch

**City Center Branch** has the highest transaction value. Other branches can learn and **apply its working methods**.

## Keep Existing Customers Active

Money moves a lot but does not stay long in accounts. Focus on **keeping customers engaged** so balances remain higher.

## Encourage Higher-Value Transactions

Motivate customers to **make fewer but higher-value transactions** to improve efficiency.

## Follow the Same Process in All Branches

All branches perform similarly, so **using the same working process everywhere** will improve consistency.

## Strengthen Online Transaction Safety

Since customers use multiple transaction methods equally, **improving digital security** will reduce risk without affecting usage.

## Automate Fraud Checking

Manually reviewing many suspicious transactions takes time. **Automation can make this faster and more accurate**.

## Track High-Activity Banks and Branches

Branches and banks with higher transaction values should be closely monitored to **ensure growth is healthy and safe**.

# CONCLUSION

This project analyzed bank debit and credit transactions to understand money flow, customer behavior, and transaction patterns. The analysis shows balanced credit and debit activity across banks and branches, indicating stable operations. Transaction trends remain consistent over time, with a drop in December due to incomplete data. However, the high number of suspicious transactions highlights the need for stronger fraud monitoring to support better decision-making and risk control.

**THANK YOU**
